Please take a look at the separate pages for the various CAD software products and updates. AutoCAD 2018 is the latest release in the AutoCAD family. It is a complete re-imagination of AutoCAD, with new features, a unified user interface, and an all-new cloud-based technology. AutoCAD 2018 is a major release, and an important development in Autodesk's CAD product strategy. The goal of this strategy is to offer a single integrated cloud-based solution for all of our CAD customers. Features of AutoCAD 2018 New Features New Smart Guides With AutoCAD 2018, you will notice the use of Smart Guides. Smart Guides automatically calculate the edges of the design that you draw, saving you time. If your design changes, you will notice that you no longer have to 'redraw' the guides. After you place your AutoCAD objects on your drawing canvas, Smart Guides calculate the proper placement for any line, arc, arc segment, spline, surface, or component. In addition to the new Smart Guides technology, we have also introduced two other new tools, Smart Objects and Smart Points. New Smart Objects New Smart Points Autodesk's Smart Objects in AutoCAD are an exciting new tool that helps you manipulate existing objects. You will find that, with Smart Objects, you no longer have to re-position or re-rout the object. For example, if you had an object that was rotated, you could apply a transform to the Smart Object, set the options for the object, and release the Smart Object. The object would then snap to the Smart Object's new position. With the introduction of Smart Objects, it is no longer necessary to re-position or re-route objects when you want to rotate or manipulate them. Because Smart Objects automatically calculate the edges of the design that you draw, the transform is applied to the entire object, including splines and other auxiliary objects that are not part of the final design. Using Smart Objects and Smart Objects together, it is possible to create a design that

Q: How to migrate the redirection after a GET request to a POST request in a Web API? I have a GET method with a link like: /api/product/{productID}/images/{imageId}/overview In the Web API, it must be changed to: /api/product/{productID}/images/{imageId}/overview So that I can work with the POST request. This is my GET method: [HttpGet] [Route("api/product/{productID}/images/{imageId}/overview")] public IHttpActionResult Get(int productID, int imageID) { var product = _db.Products.Find(productID); if (!product.IsActive) return Unauthorized(); if (product.Images.Any(i => i.ID == imageID)) return Ok(product.Images.First().Summary); return NotFound(); } So how do I migrate this redirection to a POST request? A: One simple way would be to use the HttpGetAttribute. public IHttpActionResult Get([HttpGet] [Route("api/product/{productID}/images/{imageId}/overview")] int productID, int imageID) { ... } [HttpGet] [Route("api/product/{productID}/images/{imageId}/overview")] public IHttpActionResult Get(int productID, int imageID) { ... } List of Spanish Film Award winners This is a list of recipients of the Spanish National Awards in the category of Best Film. 1957–1965 1965–1969 1970–1979 1980–1989 1990–1999 2000–2009 2010–2019 Notes References External links Spain Category:Lists of Spanish films Category:Spanish film awards Category:Spanish film-related listsQ: Is there any way to add a counter variable in R by reading a column from a data frame
