ObjectARX AutoLISP Visual LISP VBA XLL Microsoft Visual Studio .NET Raster graphics editors Raster graphics editors are a group of software packages which convert digital vector graphics) to bitmaps and also optionally rasterize vector graphics (or mesh polygonal models). The term often does not include package formats (or layers) that are intended to carry more than bitmaps, but rather those that can be used to read and write files in both vector graphics and bitmap formats. Paint programs Paint programs, such as Corel Painter, Paint.NET, Paint Shop Pro, etc., are a group of graphics software packages which manipulate, transform, and edit digital bitmap images. These programs use drawing and/or painting modules which create and edit layers which may be stored in a file. For the general purpose Paint.NET, there are two types of paint programs: the painter (for drawing) and the image processor (for manipulating images). They both work on bitmap images. Paint programs are generally quite powerful, with various features including layers, filters, layer effects, brush settings and shape transformations. However, they can be very complex programs that are difficult to learn. Other vector graphics editors are available which are often used for more specialized tasks, such as: Adobe Illustrator: Uses vector graphics and raster graphics editor, but uses vector graphics editor, but uses vector graphics editor interface. Inkscape: Uses vector graphics editor does a core C++ API. They typically provide access to a platform-specific API, thus simplifying the programming effort. Some graphics and Painter use is still only recommended for experienced programmers.
