With the introduction of AutoCAD 2009, Autodesk developed several tools that allow users to create dynamic web applications. These tools are based on object-oriented techniques and allow users to drag, drop, and link web page elements together. This guide will help you create your own online web application with AutoCAD. This guide assumes you have some basic familiarity with web applications. If you are not familiar with these terms, you can read more about them on Wikipedia. If you are interested in creating a web-based product or web application using AutoCAD, then this guide will take you through the process of developing a basic system in AutoCAD, then you will use the Autodesk Licensing Server to load that application onto the internet. If you are a web developer that already has a project, this guide will show you how to use the web development functions in AutoCAD in order to integrate the application functionality into AutoCAD. Once the application is complete, you will upload the application to an Autodesk cloud infrastructure to be hosted and published. You will then be able to point a web browser at the URL that Autodesk generates and load the web application. If you already have the AutoCAD application, you will be able to convert it into a web application using a few simple steps. This guide will help you get up and running in only a couple of hours and has been designed to provide a basic system for your first attempt. Table of contents: Introduction Step 1: Preparing Your Computer Step 2: Installing AutoCAD Step 3: The Web Application Step 4: Deploying to the Autodesk Licensing Server Step 5: Publishing the Web Application Web Development Tutorials Introduction This guide is a tutorial for beginners and intermediate AutoCAD users. In order to use the tools in AutoCAD for web development, you will need the following: A running version of Autodesk AutoCAD. You will also need a web server, which is not as difficult as it sounds. Desktop 2012. Features AutoCAD can draw and edit architectural and construction drawings, as well as product design drawings. The software has a command-based user interface with a graphic and text-based command language that enables a variety of "drag and drop" capabilities. Many CAD applications are designed around the feature set provided by AutoCAD. For example, numerous construction project management software packages are based on the geometric modeling capabilities of AutoCAD. Several of these are AutoCAD-based: Project Builder is a Microsoft Visual Studio add-on that automates the creation of many common construction project management features. Dynavox Vista is a project management tool for the Microsoft Windows operating system. Some versions of AutoCAD support page layout through use of the RAD toolkit, specifically RadControls. RAD controls are a Microsoft component that adds form-like elements to the graphical user interface of applications. The BIM Exchange Format is a drawing exchange format for AutoCAD, and also allows import and export of data to and from Revit.
