Adobe Photoshop Elements Adobe Photoshop Elements is a wonderful program that gives you a basic view of the image you may be editing. You can apply image-editing functions to a chosen area, and Elements even supports several image-editing operations, including cropping, filtering, adjusting contrast and brightness, and adjusting red-eye. FIGURE 3-8: The dialog box for the Layers panel lets you easily change the way you display your images. You can also apply artistic effects to individual color areas of an image or to the entire image. Elements even offers tools for creating VECTORS, which are like raster images but can be manipulated and converted to any format — for example, JPEG, TIFF, PDF, or EPS. The program includes the following features: * A bundled thumbnail browser * **Adjustment layers:** Set the image's exposure, contrast, and white balance. * A crop tool with several options for cropping. * **Colorize:** Transform normal JPEG or TIFF images into color images. * A blur filter for blurring images. * **Red eye removal:** This tool works with JPEGs and TIFFs. * **Red-eye removal filter:** This filter works with JPEGs and TIFFs. * The ability to format, edit, and print multipage TIFFs with a single file. * A pan and zoom feature for finding and selecting a specific area within the image to edit. * **Rotate tool:** Rotate images — TIFFs and JPEGs. * **Straighten tool:** Move or rotate crooked images or pictures within a grid to correct them. Using the Edit tool, you can manipulate images by applying filters and drawing shapes and text within the image.

1. Field of the Invention The present invention generally relates to a dispensing apparatus for detergent or other soaps, or the like, of the domestic type, and, more particularly, to an apparatus that does not require a separate bucket for containing the soap which is dispensed. 2. Description of the Prior Art For several years, plastic dispensers have been used to dispense liquids, such as detergents, cleansers and the like. Generally, these devices consist of a cartridge which is removably disposed in a dispensing tank having an outlet duct of some type. The cartridge includes an actuator such as a squeeze-trigger which extends from the bottom of the cartridge to the top thereof. The upper end of the actuator includes a piston positioned therein, which is coupled to a stem extending from the bottom of the cartridge. In order to dispense the liquid from the cartridge, the user squeezes the actuator downwardly such that the piston is forced against the liquid to be dispensed and, consequently, a portion of the liquid is forced upwardly from the cartridge through the stem and through the outlet duct. While the above-described plastic dispensers have proven to be highly satisfactory, a significant problem exists in that they require a separate holding container to receive the liquid to be dispensed, which must be periodically filled. This is true even when the container is provided with a replaceable cartridge. It has been found that, although all of the liquid contained in the cartridge can be utilized, the reservoir must be replaced or refilled quite frequently, particularly when the liquid being dispensed is a detergent or soap. Replacement of the reservoir is not only a time-consuming undertaking, but it also requires a separate, relatively expensive, replacement container. Q: Why isn't my NASM program using function parameters? I am trying to rewrite this long library in NASM that contains a lot of functions, most with several parameters. Why isn't this working? I get this error: error: Expression: bad input but if I just paste the code directly into a.asm file, it works fine. Here is the original code: SECTION.text global _start _start: movew 0, r0

An access control device is a sensor and/or fob device which unlocks or otherwise locks a lock when a user approaches or moves in a particular direction. Access control devices, particularly those using infrared or radiofrequency (RF) transmission, can be more secure than mechanical, electrical or magnetic key/fob combinations as they eliminate the need for a key to be present for the lock to open and can provide additional security because the access control device is not accessible to the lock owner. For example, the access control device may be either a keyfob which is attached to the user's keychain or a free-floating, battery powered device which can be used with various locks, including deadbolt locks. In many applications, the access control device will be locked in a storage unit to protect the device from loss, theft or damage. The internal circuitry of an access control device typically includes a memory component to store access codes for a given access control unit and various other codes, such as the frequency and power levels of an alarm signal, used to identify whether the alarm signal has been triggered. Because the access code and other important security-related codes must be stored within the unit in a secure manner, many access control units and other key control or other smart card devices include a tamper-proof seal or snap lock which is used to protect the internal circuitry of the access control device from unauthorized tampering. In a standard hand-held, battery powered key fob, for example, the tamper-proof seal extends over the battery housing and is disposed near the surface of the body of the device in order to keep the housing tamper-proof and to keep the battery from being exposed. In a hand-held keyfob which transmits signals over the air, the tamper-proof seal is generally positioned within the housing. In the case of a hand-held keyfob and certain other smart card devices, it is generally not possible to test the circuit because it is enclosed within the housing of the device. As a result, the user is unable to confirm that the fob works before activating it. In the case of a mechanical key, the user is able to see whether the mechanical key is properly configured by examining the lock, thus obviating the need to trust that the mechanical key will work. However, it is still possible for the user to activate an access control device which will not work. For example, if the tamper-proof seal is damaged or broken when the device is stored, the access
