hour or by project. A computer bus, generally, supports a transfer of data or signal between a computer and a peripheral device. One of the attributes of a computer bus is its input/output (I/O) speed. I/O speed determines the bandwidth (the rate of

data transfer) of the computer bus. Another attribute of a computer bus is its power consumption. Power consumption is the amount of power a computer uses to operate itself. A computer bus that has a higher I/O speed generally has a higher

bandwidth and uses less power. However, most computer buses also have a higher cost. Therefore, computer users are often faced with tradeoffs between high-speed I/O, and power, and cost. One example of a computer bus is a peripheral component

interconnect (PCI) bus,
which transfers data
between a central processor
unit (CPU) and a peripheral
device. The PCI bus
provides an address bus, a
data bus, and a control
signal bus. The address bus
supports the address of a
particular peripheral device

to be used. The data bus is a 16 bit data bus that is used to transfer data between the CPU and the peripheral device. The control signal bus is used by the CPU to generate a set of signals to the peripheral device. The control signal bus includes an address signal, a control

signal, and an address
strobe signal. The address
strobe signal indicates to the
peripheral device the
