Search News The Make-or-break Point: When Should You And When Should You Not Drop Your Price? by Michael Wein Before we delve into the Make-or-Break Point question, let me explain what that term actually means and why it is so important. To do that, we need to take a quick detour into contingency theory. Contingency theory is a branch of mathematics that deals with conditional probability. Since this article will focus on the application of Contingency Theory to the inventory calculations that all businesspeople do, we are only going to need a basic understanding of the theory. In fact, I wrote a short article for the GSS vendor training program that you should consider reading if you are interested in learning more about contingency theory. A popular example of Contingency Theory was illustrated during a game of telephone called "Simon Says". Imagine a group of people with a pre-arranged instructions. Suppose a person stands up and yells out, "Simon Says". Now, each of the people starts repeating this phrase, one by one, immediately followed by another person. So, the next person says, "Simon Says", etc... As time goes on, you would observe that the people who are more physically close to each other will hear the phrase earlier than those who are farther away. For instance, suppose that the last person to say "Simon Says" happens to be the person who is farthest away from the rest of the group. Now, if the first person says "Simon Says", it would be logical for the rest of the group to all expect to hear that the person who is closest to them all said "Simon Says". However, if the first person says something different, like, "Are you coming or are you going?", it would make no sense for the last person to say "Simon Says". Since their neighbor was not actually saying "Simon Says", then "Simon Says" would not apply to them.
