How to switch between models AutoCAD is one of the premier CAD software programs available in the market today. It is widely used in construction, engineering, architecture, manufacturing, and more. The following content, written by Mahesh Mahadevan, explains how to switch between models and navigate around your drawings. Select the desired model The very first step that you need to perform in AutoCAD is to select the desired model to work on. You can do so using any of the following methods: Use the Open command in the command bar Select the desired model from the Model Browser and press Enter. Or, if you have multiple models open, you can open the desired model by using the Open command in the command bar. Open

the selected model This command starts with the first model that you have open and moves to the next model in the same drawing. If you do not have any models open, then you can either create a new drawing or open a new model using the Open command. The key to using the Open command is the openmodel variable. In the following sections, we will learn how to use the openmodel variable in AutoCAD. How to switch between models The openmodel command enables you to open the next or the previous model in a drawing. This is the key to using the Open command. It is also useful in the following situations: To open a model that is saved in another drawing To open a drawing that is not associated with a model To open an empty drawing To open a particular model, even if there are multiple models open. To open a model that you want to open last To open a model that you have just

created To open a model that has been saved with a different name To open a model that you want to open immediately To open a previously open model Use the following steps to open the next or previous model in a drawing: 1. Open the model using the Open command. 2. To open the next model, use the opennext command To open the previous model, use the openprevious command 3. If the opennext command does not open the next model, use the openone command. How to switch between views The Open command is also used to open views. To open a particular view,
