The `DataSourceProvider` is the first caller to the `await` operator and will decide when the data fetching process should be complete and will complete the initialization of the application's data store and the caches, if configured. `DataSourceProvider` is injected at the class level and exposed in the `inject` method. It is also responsible for injecting the `DataSource` that will be returned to the implementations that make use of the `DataSourceProvider` by the `DataSourceProvider` itself. ## Default Data Source By default, the default `DataSource` will be available in most apps. This will be an instance of `Phoenix.LocalDataSource.Repo` class. This class uses the `local_repo` key to instantiate the `LocalDataSource.Repo` instance. ``elixir data_source = DataSource.default()`` ## Custom Data Source The `DataSourceProvider` can be configured to return a custom data source. There are two supported options: - `DataSource.CustomDataSource` - `DataSource.CustomDataSource{}` a1d647c40b

drawings. You can use a template to save the step of adding a logo and title, so you don't need to worry about choosing a template that matches your style. You can use the `TEMPLATE` command to add a template. Completely change the way you import existing drawings, including CAD files or DWG files. You can use the new Import Mode command, which will eliminate the step of converting drawings from one format to another. New filter and analysis tools: Whether you're drawing architectural plans or assembling furniture, you'll find new tools to help you visualize and analyze your design process. With the new filter tools,
