Is there a general timeline? A: The response of the blood vessel lining has a big influence on the survival of a heart attack: response time is the time from the onset of the heart attack to the moment when the blood supply is blocked and blood starts to accumulate recovery time is the period where the blood supply is blocked but it is somehow restored, i.e. the blood flow is enough to keep the tissue alive for a certain time The actual time of blood flow reduction leading to tissue death ranges from seconds to a few minutes: a coronary artery bypass grafting can be successful with a blood flow obstruction time as short as 70-180 seconds primary angioplasty is successful if the blood flow obstruction lasts 3-5 minutes Basin Volume: The Indian and the Tibetan Basin Volume: The Indian and the Tibetan Synopsis Volume one of a multi-volume study of the relationship between Tibet and the Indian subcontinent from 1500 B.C. to the present day. Glibenclamide (Glib) is the only widely-used drug for the oral treatment of type 2 diabetes. In spite of many years of intensive studies, the mechanism of its action has not been clearly demonstrated. Here we hypothesize a dual mechanism for the antidiabetic effect of Glib. In the first mechanism Glib activates Ca²⁺ entry through channels during fasting periods, followed by the inhibition of insulin-induced membrane-potential hyperpolarization (IPH). Such effects of Glib decrease the free cytosolic Ca²⁺ concentration (Cai), thereby inhibiting the insulin-induced metabolic responses. In the second mechanism Glib does not activate Ca²⁺ entry through channels but increases the membrane permeability to Ca²⁺ ions (PMCA) and inhibits IPH, thereby decreasing the Cai. That is, in the fasting state Glib contributes to the decrease in Cai and releases intracellular Ca²⁺, but in the postprandial period Glib increases the PMCA, and thereby decreases the Cai without releasing Ca²⁺. These mechanisms may be the answer to the clinical observation that some patients with type 2 diabetes show a rapid improvement in blood glucose levels after administration of Glib.Soybean Glycine max (L) is an important oil seed crop and a valuable field crop. However, it began as a wild plant. This plant and a number of other plants have been developed into valuable agricultural crops through years of breeding and development. The pace of the development of soybeans, into an animal foodstuff and as an oil seed has dramatically increased in the last one hundred years. Planned programs of soybean breeding have increased the growth, yield and environmental
