But it has the advantage of being well-trained, quick to get started with and surprisingly flexible. Conventionally, an electrical connector includes an insulating housing made of an insulating material and configured for receiving a connector plug. The housing has a mating face and an opening. The opening is defined by a peripheral surface portion of the housing that is in alignment with the mating face and a flange, which surrounds the peripheral surface portion. A plurality of conductive contact portions is exposed in the opening for engaging with a corresponding conductive terminal of the connector plug. The contact portions are arranged in an array along the peripheral surface portion. The contact portions are made of conductive metals such as tin plated copper wire. However, tin plating of the contact portions may be insufficient. In addition, if the contact portions are formed by stamping, the stamping step may be complicated, and expensive equipment is required. Also, the contact portions may have a poor junction, and the contact portions and a wire may be damaged by friction during assembly.
