Substitution and arrangement of restriction sites in the p15 and p16 genes of adenovirus types 2 and 5. Nucleotide sequences of the left and right ends of p15 and p16 genes of human adenovirus 2 and 5 have been determined. The left ends of the two genes share common sequence features which are not seen in those of other adenoviral genes. Sequences of four restriction endonuclease sites in the early region were found to be the same in both types. The primary structure of these two genes were also compared with that of adenovirus type 1, which is highly homologous with adenovirus 2 and 5. Ligand-induced changes in electrophoretic
