Only the elements that you add to a saved image are permanent. Be sure you save your changes before moving an image from one folder to another or to another computer. Removing and re-creating layers Photoshop uses layers to contain your image. A layer is made up of a group of pixels that you can hide or show to see exactly what is inside. For some of the design elements available in Photoshop, such as text, using layers allows you to keep your original image intact. If you hide the text layer, you don't see the letters, but if you show the text layer, you can edit the text. If you delete the text layer, you still have the original raster image. Layers help designers and photographers bring in new images without introducing headaches later. You can use layers to add more images, blend image colors, create special effects, and much more. You can create layers using the Layers panel in the Layers panel or in the Photoshop workspace. You can also create layers from scratch through the New Layer dialog box, shown in Figure 4-3. **Figure 4-3:** Layers are so important they have their own panel. In this section, you see a basic tutorial for using Photoshop's Layers panel to create layers and overlay layers to create special effects. Follow along with the steps to get started with creating your own layers: 1. Open a new image. Use a dark and light photo of a building as an example. 2. Click the New Layer icon (it looks like a plus sign) in the Layers panel and choose Color from the menu to create a new color layer. 3. Select the Fill tool from the Tools panel and click the rectangle you created on the color layer to place it on the new layer in the image. 4. Make sure the Create New Fill or Adjustment Layer option is selected from the Layers panel, as shown in Figure 4-4. 5. Click in the image to hide the background and use the Selection tool to create a selection around the horizon line. **Figure 4-4:** A selection can be used to change the color or make patterns visible only in the pixels of the layer. 6. Press the Spacebar on your keyboard to activate the Magic Wand tool. 7. Click the white square on your image and

drag the magic wand around the selection to make sure you have

The most common questions that we receive are related to the basic tasks in graphic design, where the use of software is clear or where people just think a little about how to use the program. Like any other software, Adobe Photoshop requires a computer and internet connection. We will tell you about the best budget software for a photographer with a small budget.

How to use Photoshop on Mac or Windows First of all, the program requires a system that runs on the Windows platform and Mac. The software can be purchased as a DVD or as a disk through the online store.

Navigation and basic functions How do I open a Photoshop file? It is very simple. Just select the file. When the file is selected, press and hold the shortcut key (usually Alt). A menu with the options "Open in Photoshop" or "Open in..." will appear. You can also press the F-key or click the "Open Photoshop" button from the menu. If the file is not there, you can press Ctrl+O. To close a file you can press the shortcut key (usually Alt), or if the file is open and active, just click the "Close" button.

How do I get into the tools? You can navigate between the tools simply by pressing the F-key (or the button "Actions" on the top bar). You can use the shortcut keys to access specific tools.

How do I save a file? The easiest way is to just click the "Save" button, or if it is already selected, press Ctrl+S. Where are the changes made to the file? Photoshop does not save the file but saves the data in a different location. When you save the image, you're just copying the images from the existing location to the new location, in this case the folder on your computer. If you need to update the file, you need to open it again.

How can I undo an edit or selection? You can undo the last edit on a layer or just an effect by pressing Ctrl+Z. You can use the Undo key shortcut on any tool, like P, L, S, or J to undo the last action. This should be enough to get you through most simple Photoshop tasks. [Cardiogenic shock: incidence, risk factors, and outcome in patients with ST elevation acute myocardial infarction]. to identify the incidence of and factors associated with cardiogenic shock (CS) in patients with ST elevation acute myocardial infarction (STEMI). this was a prospective study of patients with STEMI who were admitted to a coronary intensive care unit between January 1998 and December 2002. The patients were followed until discharge or for at least three months. A total of 617 patients were admitted during the study period. Cardiogenic shock was present in 23 (3.8%). Patients with CS were older, more frequently had multivessel coronary disease, lower ejection fraction and higher Killip class at admission. There was no difference between patients with or without CS regarding: time from symptom onset to invasive strategy, mean delay time to coronary angiography, infusion of glyceryl trinitrate, number of emergent coronary angiographies performed, number of emergent percutaneous coronary interventions and number of patients receiving primary coronary intervention. Ten patients with CS were classified as class A according to the European System for Cardiac Operative Risk Evaluation II and had no CS. Six (26%) of the remaining CS patients required inotropic support in the first 24 hours and seven (30%) needed intra-aortic balloon pump (IABP). Two (9%) presented cardiogenic shock with evidence of low cardiac output. Early mortality was 24%, and was higher in patients with CS than in those without (51% vs. 9%, $p = 0.008$). In the multivariate analysis, cardiogenic shock was an independent risk factor for in-hospital mortality (RR = 3.3, 95% CI = 1.6 to 7.4). Patients with STEMI and CS presented a high incidence of low cardiac output during the hospitalization and high in-hospital mortality. The identification of CS at the time of hospital admission was associated with in-hospital mortality.
