Virtual keyboard with mouse support for Windows 10. It's been a few months since the last update and the developers continue to stay with the trend of finding ways to improve their products. So far, we've enjoyed the Vibro Master - a master controller for your PC. Now there's another version being released, so if you were looking to own both - then you're in luck. The VibroFx2 allows you to remap several keys on your keyboard to make them work as diverse as possible. You can also use the device for other purposes, since it's also a USB MIDI controller as well. What is VibroFx2? The first version of VibroFx was released in June of 2016 and proved to be a great tool for anyone who enjoyed the experience of playing live music, both acoustic or electronic. The Vibro Master was a very decent alternative to the numerous MIDI controllers available in the market. It allowed users to control the parameters of a virtual keyboard, essentially turning it into a virtual MIDI controller. The VibroMaster was easy to use, has an easy interface, and offers a wide range of parameters you can use to tweak your virtual keys. The VibroFx 2 supports two unique features - mixing two virtual MIDI controllers into one application, and creating your own virtual keyboard parameters. It also supports MIDI-CV assignment and saves settings on the device as well. So if you wanted to use all of your MIDI controllers on your computer for convenient use, the VibroFx2 would be a very good choice. How does it work? Simply put, VibroFx2 allows you to create two virtual keys on the keyboard, that would allow you to edit the parameters in tandem. So if you wanted to set up two keys to control certain effects on the virtual keyboard, then you can simply do this by clicking on the "Add" button, and choose your desired MIDI controller, before selecting the desired function. The device will then allow you to map it to the desired key. In our example, we would choose the rotary encoder on our second virtual key (first button) so that we could control the pitch bend. After the mapping of the function is complete, you can save it in the settings of the application and repeat the process for the other MIDI controller. Apart from the basic function, there's plenty of customization you can do
