That's okay, but it is important to realize that the world of digital manipulation is a complex world. There are tools for many purposes and workflows to work with specific circumstances. You can find a way that's right for you. When choosing a particular filter, make sure to ask yourself, "Do I need this filter for what I'm trying to do? Is this the best way to accomplish what I'm trying to do?" A filter can be extremely useful or as dangerous as a cowboy's six-shooter. Don't use a filter you don't understand. # **A PHOTO'S MULTIPLE LAYERS** Layers are the building blocks of Photoshop, and they can be used to manipulate an image in many different ways. There are different types of layers, and most of them work differently. Layer types * _**Background**_ This layer just shows the image. It is generally the first layer added to an image when working in Photoshop. * _**Clipping**_ When you clip a part of an image out, it becomes a layer and will appear below the Background layer. * _**Composite**_ You can create a new layer that has the same color or density of its background to help create a new image. * _**Clone**_ When you clone an object, it creates a new layer to give you

In my last post, I gave a 2-part overview of the new API for Google App Engine Python. Part one, which focused on the Python App Engine SDK, gave a high-level overview of how to create and deploy Python web applications, although a lot of the discussion was restricted to simple web sites. Part two, which began with a brief description of the Python SDK (and which I'm continuing here), discussed the basics of application configuration. I'll continue on a bit of a tangent to talk about some of the application configuration settings and the various values you can use to configure your application, as well as how you can debug, test, and optimize your applications. This post will focus on the following: Configuring your application with environment variables Configuring your application with "config.py" Configuring the application and environment with a service account Configuring the application with appcfg It's important to note that the options described here don't necessarily refer to how you have to configure your application for deployment. In fact, you may see some differences in how you configure your application on your local workstation and your production server. I'm not going to dive into that here, but it is worth noting that there are some subtle differences. Environment Variables Environment variables are simple, predefined values for the runtime of your application. You can have as many as you'd like and they're specified in the runtime section of your app.yaml file. The runtime section of your app.yaml file looks like this: runtime: python27 runtime_version: 3 Since the runtime is specified in the app.yaml file, this is all that is necessary to configure your application for Python App Engine. Using environment variables, you can define a configuration that is specific to the runtime of your application; in other words, you can define settings that only apply for Python runtime and nothing else. The exact syntax of the configuration settings is as follows: property=value There are a few important things to note about the syntax: A property must have a value. There can be no spaces, colons, or semicolons in a property name. Values must be strings, ints, floats, lists, etc. Properties are case-sensitive, and you must always refer to the property by its

Surgical site infections: stay the course. In this article, the authors review the most recent literature related to wound management after surgery. Although the incidence of surgical site infections in elective abdominal surgery has decreased significantly, contaminated or dirty wounds are still an issue. The authors review currently recommended options for prophylactic and treatment-related care. Despite evidence that a hand-held ultraviolet germicidal device can be used successfully to mitigate the risk of bacterial contamination in the preoperative and postoperative periods, the most cost-effective alternative is ensuring proper coverage of the sterile field.Metabolic activation of organotellurium compounds by hepatic microsomes. The bioactivation of certain halogenated alkyltellurium compounds, such as 3-bromo-1-(2-chloroethyl)-1-nitrosourea, 5-(2-chloroethyl)-1-nitrosouracil, N-3-acetyl-2-(N-methylcarbamoyl)-4-methyl-5-amino-2-pyridine-butanamide, and N-(4-t-butyl-4-phenyl-1,2,2-trimethyl-3-tetrahydro-1H-pyrrolo[3,2-b]-pyrrolidin-1-yl)carboximidamide (BW B80C), has been investigated. In vitro incubation of each compound with rat liver microsomes generated carbonium ions (R. Frank, I. van de Vijnhoven, P. van der Steen, H. de Looze, Chem. Res. Toxicol. 13 (1996) 68-72) from which reactive epoxide intermediates were eliminated by nucleophilic attack of water, yielding 3-chloro-1-(2-chloroethyl)-1-nitrosourea, 5-(2-chloroethyl)-1-nitrosouracil, N-(4-t-butyl-4-phenyl-1,2,2-trimethyl-3-tetrahydro-1H-pyrrolo[3,2-b]-pyrrolidin-1-yl)carboximidamide, and N-(4-t-butyl-4-phenyl-1,2,2-trimethyl-3-tetrahydro-1H-p
