with large v_{WZ} is considerable. The dominant contributions of the WZ loop amplitude comes from the graph with a double WZ vertex in the loop. Two possible graphs are depicted in Fig.\[fig:3\]. ![The scattering amplitudes with one and two propagators in the loop. Blu iFixit. Udayananu Tharam 720p Movie Download Utorrent1. Field of the Invention The present invention relates to a developing method, an image forming device, and a developing cartridge, and, in particular, to a developing method, an image forming device, and a developing cartridge suitable for

developing a latent image formed on an image carrier. 2. Description of the Related Art Image forming devices capable of performing an image forming process on various types of media, such as paper and cloth, have been widely used. An example of such an image forming device is an electrophotographic image forming device. In the electrophotographic image forming device, a surface of an electrophotographic photosensitive member (hereinafter, referred to as an "image carrier") is uniformly charged by a charging unit. Next, the image carrier is selectively exposed by a laser beam modulated according to an image signal, thereby forming an electrostatic latent image on the image carrier. The electrostatic latent image on the image carrier is developed into a toner image using a developing unit. Finally, the toner image is transferred to a media to form a desired image on the media. Generally, the developing unit is provided with a hopper storing toner, a developing roller, a supplying roller, a regulating blade, and a toner collecting member. The toner stored in the hopper is transported by a screw or the like to the developing roller. The developing roller is held at a predetermined gap

from the image carrier. The developing roller transfers the toner to the image carrier, thereby developing the electrostatic latent image on the image carrier into a toner image. In the developing unit, the toner transported to the developing roller reaches the toner collecting member by the rotation of the developing roller. The toner reaching the toner collecting member is transferred to a surface of the toner collecting member and forms a layer, and is transported to the regulating blade. The toner on the regulating blade is regulated to a desired height by the surface of the regulating blade and supplied to the image carrier. Since the image forming device is able to form a high-quality image, the image forming device has been becoming more high-speed. To achieve high-speed image formation, it is required to increase the surface speed of the image carrier. To increase the surface speed of the image carrier, it is required to reduce an amount of a toner collected by the toner collecting member
