We isolated several inhibitors from the urine of patients receiving immunosuppressive doses of cyclophosphamide. Two potent inhibitors, J-9 and J-10, were identified by their ability to block Fc- and C3bi-dependent antibody-mediated cytotoxicity against human lymphoid targets by macrophages. J-9 inhibited antibody-mediated cytotoxicity by human and rabbit macrophages but did not inhibit a cytolytic granule-dependent, C3-independent antitumor cytotoxicity mechanism. J-10 inhibited only the antibody-mediated cytotoxicity and was not active against tumor-cell-mediated cytotoxicity. Both inhibitors suppressed antibody-mediated cytolysis in a concentration-dependent manner. The levels of these inhibitors rose in the urine of patients receiving cyclophosphamide. In vivo J-9 prolonged survival (P less than 0.05) when administered to mice bearing advanced solid tumors. We suggest that these inhibitors may regulate antibody-dependent cellular cytotoxicity activity in vivo and that they may be useful in the therapeutic manipulation of antibody-dependent immune responses. The present invention is concerned with a handle for a slide fastener and more particularly relates to the design of a handle for a slider wherein the handle includes a component which is a molded plastic part that forms the grasping portion of the slider. The molded plastic component is molded to receive and retain the slider and the component integrally joins the handle component and the slider component with an integral hinge. The handle component and the slider component are then separated and the slider component is attached to the molded plastic component by the aforementioned hinge. U.S. Pat. No. 5,092,227, assigned to the assignee of the present invention, describes a handle component for a slider, said handle component being molded to receive the slider and integrally joining the handle component and the slider component through a separate hinge, which is molded to the slider.
